JENKINS N.A., GILBERT D.J., COPELAND N.G.;

MOUSE desmocollin (Dsc3) and desmoglein (Dsg1) genes are closely
linked in the proximal region of chromosome 18.";

GENOMICS 21:510-516(1994).

-i- FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS. INVOLVE
IN THE INTERACTION OF PLAQUE PROTEINS AND INTERMEDIATE FILAMENTS
MEDIATING CELL-CELL ADHESION. MAY CONTRIBUTE TO EPIDERMAL CELL
POSITIONING (STRATIFICATION) BY MEDIATING DIFFERENTIAL
ADHESIVENESS BETWEEN CELLS THAT EXPRESS DIFFERENTIAL
ADHESIVENESS BETWEEN CELLS THAT EXPRESS DIFFERENTIAL
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-I- TISSUE SPECIFICITY: IN ALL EPITHELIA TESTED AND HEART.
-I- DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE REPEATS

CELL BIOL. 118:1511-1522(1992).

-!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

-!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

-!- THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES. THIS CADHERIN MAY PLAY A IMPORTANT ROLE IN ENDOTHELLAL CELL BIOLOGY THROUGH CONTROL OF THE COHESION AND ORGANIZATION OF THE INTERCELLULAR JUNCTIONS. IT ASSOCIATES WITH ALPHA-CATENIN FORMING A LINK TO THE CYTOSKELETON.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. FOUND AT CELL-CELL BOUNDARIES.

-!- TISSUE SPECIFICITY: ENDOTHELIAL TISSUES AND BRAIN.

-!- SIMILARITY: BELONGS TO THE CADHERIN FORMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C. -!- FUNCTION: FERREDOXINS ARE IRON-SULFUR PROTEINS THAT TRANSFER

CC -!- FUNCTION: SEVERAL REPEABOLIC REACTIONS.

C. -!- THIS PROTEIN CONTAINS SEVERAL REPEABOLIC REACTIONS.

C. -!- SUBUNIT: VHU CONSISTS OF THE VHUA, VHUG, VHUU SUBUNTS AND A

FERREDOXIN PROTEIN.
                                                                                                                                                                                                                       METAL

SOUTH THE SULFACE OF THE SULF WE SEE THE SULF WE SULF derived from th Claim 1; Page 41; 58pp; English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein 3 protein (amino acids 512-526) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in W04841-47 Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in Strominger JL, WWWPI; 96-425218/42 12-SEP-1996. 07-MAR-1996; U03182. 07-MAR-1995; US-400796. (HARD) HARVARD COLLEGE polypeptide (whether self or non-self) includes an amino ac sequence corresponding to a sequence motif for a MHC class auto-immune disease autoantigen; HLA; human leukocyte antigen; T-cell;

Claim 1; Page 7-9; 9pp; Japanese.
W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-JAN-1997 (first entry)
Pemphigus vulgaris antigen protein extracellular region.
Autoantibody; immunoglobulin G; IgGl; fusion protein; diagnosis;

                                                                                                                                 DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; SOpp; English.
This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R30742

Disclosure, Fig 49; 20pp; English. The proteins derived from the nematode DNA may be used vaccines against parasitic infection of plants, humans esp. sheep. MAbs may also be raised to provide passive prophylaxis against infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R12099

Claim 3; Page 83-85; 102pp; English.
Mouse corticotropin releasing factor receptor mCRF-RB1 was
identified as the product of a cDNA clone (728972) isolated
mouse heart library. Recombinant mCRF-RB1 can be expressed
mouse heart library. Recombinant mCRF-RB1 can be receptor can
                                                                                                                                                                                                                                                                                                                                                                                         mouse heart library. Recombinant mCRF-RB1 can be expressed in host cells transformed by the cDNA clone. The receptor can be to identify agonists and antagonists that modulate the signal transduction activity mediated by CRF receptors. It may be administered therapeutically to reduce high ACTH levels caused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              13-JUN-1996.

Disclosure; Fig 4; 12pp; Japanese.
The vector may be used to express heterologous genes transformed host when galactose is added as a carbon Sequence 91 AA;
                                                                                                                                                                                                                                                                                  The synthetic gene encodes a protein corresponding to an antibody capable of binding to a specific antigen, in this case the HIV-1 tay protein. Many synthetic genes are synthesised, each containing a predetermined nucleotide region encoding the framework regions of the heavy and light chains of antibody and undetermined nucleotide regions which are random sequences. The genes are then used in the construction of vectors which are subsequently used to transform microbes. The proteins thus produced are screened for binding activity to the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R40924

This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's disease and rheumatoid arthitis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the degree of variation in gene expression, and particularly does not disrupt that a cancer expression.
                                                                                                                                                                                                            T 10

Claim 7; Page -; 98pp; English.

The present sequence is a specific example of a chimeric integrase made up of three domains from MoMLV and Ty3, with at least one domain derived from Ty3 integrase. This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the degree of variation in gene expression, and particularly does not disrupt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, hemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild type retroviral integrase reduces the rate of insertional mutagenesis and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chimeric integrase for targetted vector integration in eukaryotic genomes - useful for gene therapy, providing motionsistent gene expression and lower rates of insertional

CC The present sequence is the light chain variable region of the great sequence is the light chain variable region of the canti-human Fas ligand monoclonal antibody (WAb) NOK-5 NOK-5 is produced by the hybridoma NOK-5 (FERM BP-5048), which was prepared by immunising mice with transformed human Fas ligand expressing COS cells, and fusing spleen cells isolated from the mice with myeloma CC passlage 653 (ATCC CRL-1580) cells. The MAb recognises the human CC Fas ligand on the cell surface or in solution, and can be used to inhibit the apoptosis inducing cell surface Fas ligand/Fas reaction. The MAb can also be used for a Fas ligand assay in CC diagnosis, e.g. hepatitis, human blood), especially for disease CC lipus erythematosis.

apoptosis in liver cells and improves liver function Claim 6; Page 41; Slpp; Japanese.
The present sequence is the light chain variable region of the murine anti-human Fas ligand (Fast) monoclonal antibody (MAb) NOK5, which is expressed by the hybridoma NOK5 (FERM BP-5044). The MAb can be used in the preparation of a composition for the effective oral or parenteral treatment of hepatitis, including hepatitis caused by hepatitis B or C virus. The composition controls apoptosis in liver cells caused by the binding of Fast to Fas expressing liver cells, and improves liver function by improving blood glutamate oxaloacetate and pyruvate transaminase levels. The composition is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14-JAN-1998 (first entry)

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:50:33 1999; MasPar time 4.35 Seconds 138.311 Million cell updates/sec

Tabular output not generated.

Title: Description: Perfect Score: Sequence: >US-08-991-628-6 (1-15) from US08991628.pep 109 1 SARTLNNRYTGPYTF 15

Scoring table: PAM 150 Gap 15

Searched: 122810 segs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 26.619; Variance 37.654; scale 0.707

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The order of association in the morphogenesis pathway is strictly determined except for gp 11 which can be added at any stage of the pathway. Gp 8 associates to the precursor structure after gp 7 binding and before gp 6 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene 8 is directed clockwise in the T4 map; the . gene 8 overlaps with the 3'-end of gene 7 superfamily phage T4 baseplate protein gp8 baseplate; late protein specific that the protein specific specifi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Harmon, G.; Langston, Y.; Stoneking, T.; Drone, submitted to the EMBL Data Library, July 1998 The sequence of Arabidopsis thaliana T7M24. ##experimental_source strain 7-2
In the duplication in this protein results from a tandem duplication in the virus genome found in some, but not all, virus strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        273

MPsrch_pp protein · protein database search, using Smith-Waterman algorithm

Tabular output not generated Run on: Fri Jun 11 17:45:15 1999; MasPar time 2.45 Seconds 173.166 Million cell updates/sec

Title:

Sequence: Description: Perfect Score: >US-08-991-628-6 (1-15) from US08991628.pep 1 SARTLNNRYTGPYTF 15 109

Scoring table: PAM 150 Gap 15

77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Dalabase: swiss-prot37 1:swissprot

Statistics: Mean 27.195; Variance 33.825; scale 0.804

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
